A Brief (Pre-)History of Cosmic Pluralism

Raphael

~600BC: Greek philosophers discuss the infinity or singularity of Earth as a purely abstract idea – Plato and Aristotle argue for the uniqueness of Earth

~1200AD: Arabian, Muslim philosopher Fakhr al-Din al-Razi

“Therefore He the Most High has the power (qadir) to create a thousand thousand worlds (alfa alfi 'awalim) beyond this world such that each one of those worlds be bigger and more massive than this world as well as having the like of what this world has.”

The Renaissance

Giordano Bruno (1548-1600) – Italian philosopher, mathematician, ideas man, maverick

- holding opinions contrary to the **Catholic faith** and speaking against it and its ministers;
- holding opinions contrary to the Catholic faith about the **Trinity**, divinity of **Christ**, and **Incarnation**;
- holding opinions contrary to the Catholic faith pertaining to **Jesus** as Christ;
- holding opinions contrary to the Catholic faith regarding the **virginity of Mary, mother of Jesus**;
- holding opinions contrary to the Catholic faith about both **Transubstantiation** and **Mass**;
- **claiming the existence of a plurality of worlds and their eternity**;
- believing in **metempsychosis** and in the **transmigration** of the human soul into brutes;
- dealing in magics and divination.

He was arrested by the Roman Inquisition (after being turned over by his patron!)

“Perchance you who pronounce my sentence are in greater fear than I who receive it.”

A night-time photograph of an astronomical observatory. Several telescopes are visible, with bright beams of light emanating from them, creating a starburst effect in the dark sky. In the foreground, a large, circular, glowing light source, possibly a lamp or a large telescope lens, is illuminated, casting a warm glow. The background shows silhouettes of trees and a dark sky with a few stars.

*The first exoplanet
discovery was an accident!*

The field was truly born later:

- Precision spectral calibration
- Precise digital cameras (CCDs)
- Clever analysis techniques

The field today...

Mass vs. Period

29 years of Exoplanet Discoveries

1989-2017

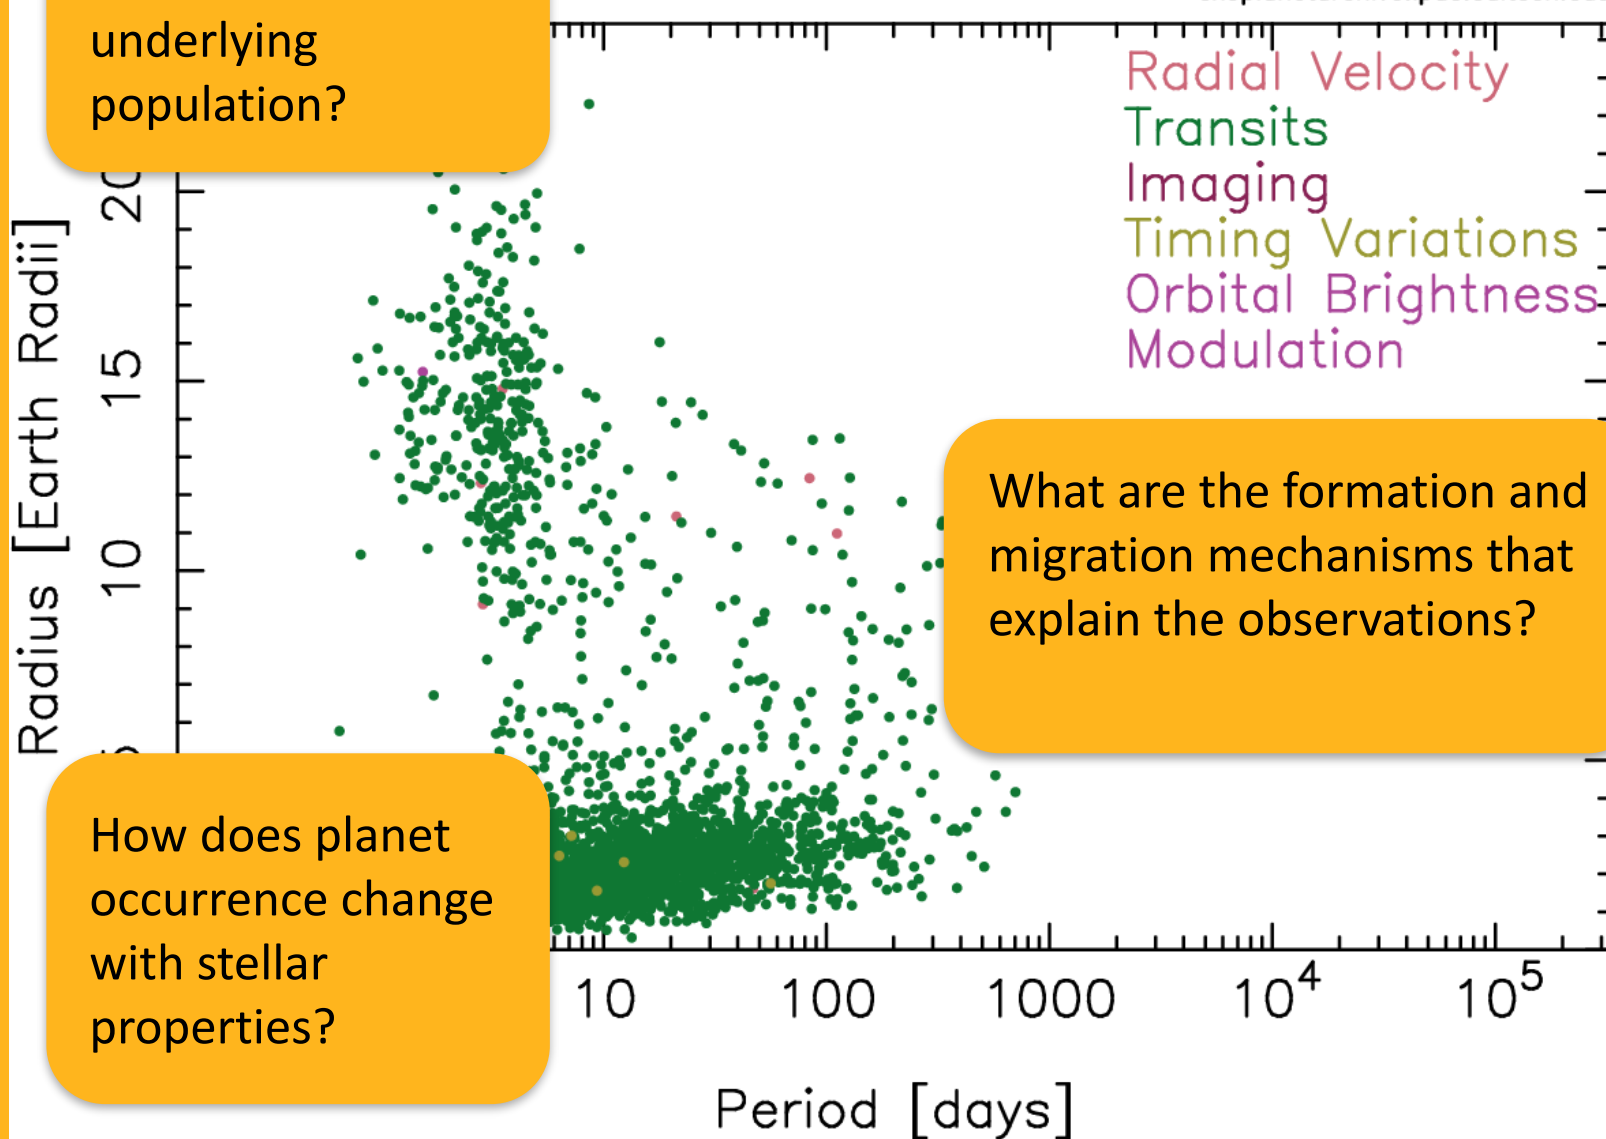

Plots generated October 30, 2017

Today!

Radius – Period Distribution

exoplanetarchive.ipac.caltech.edu

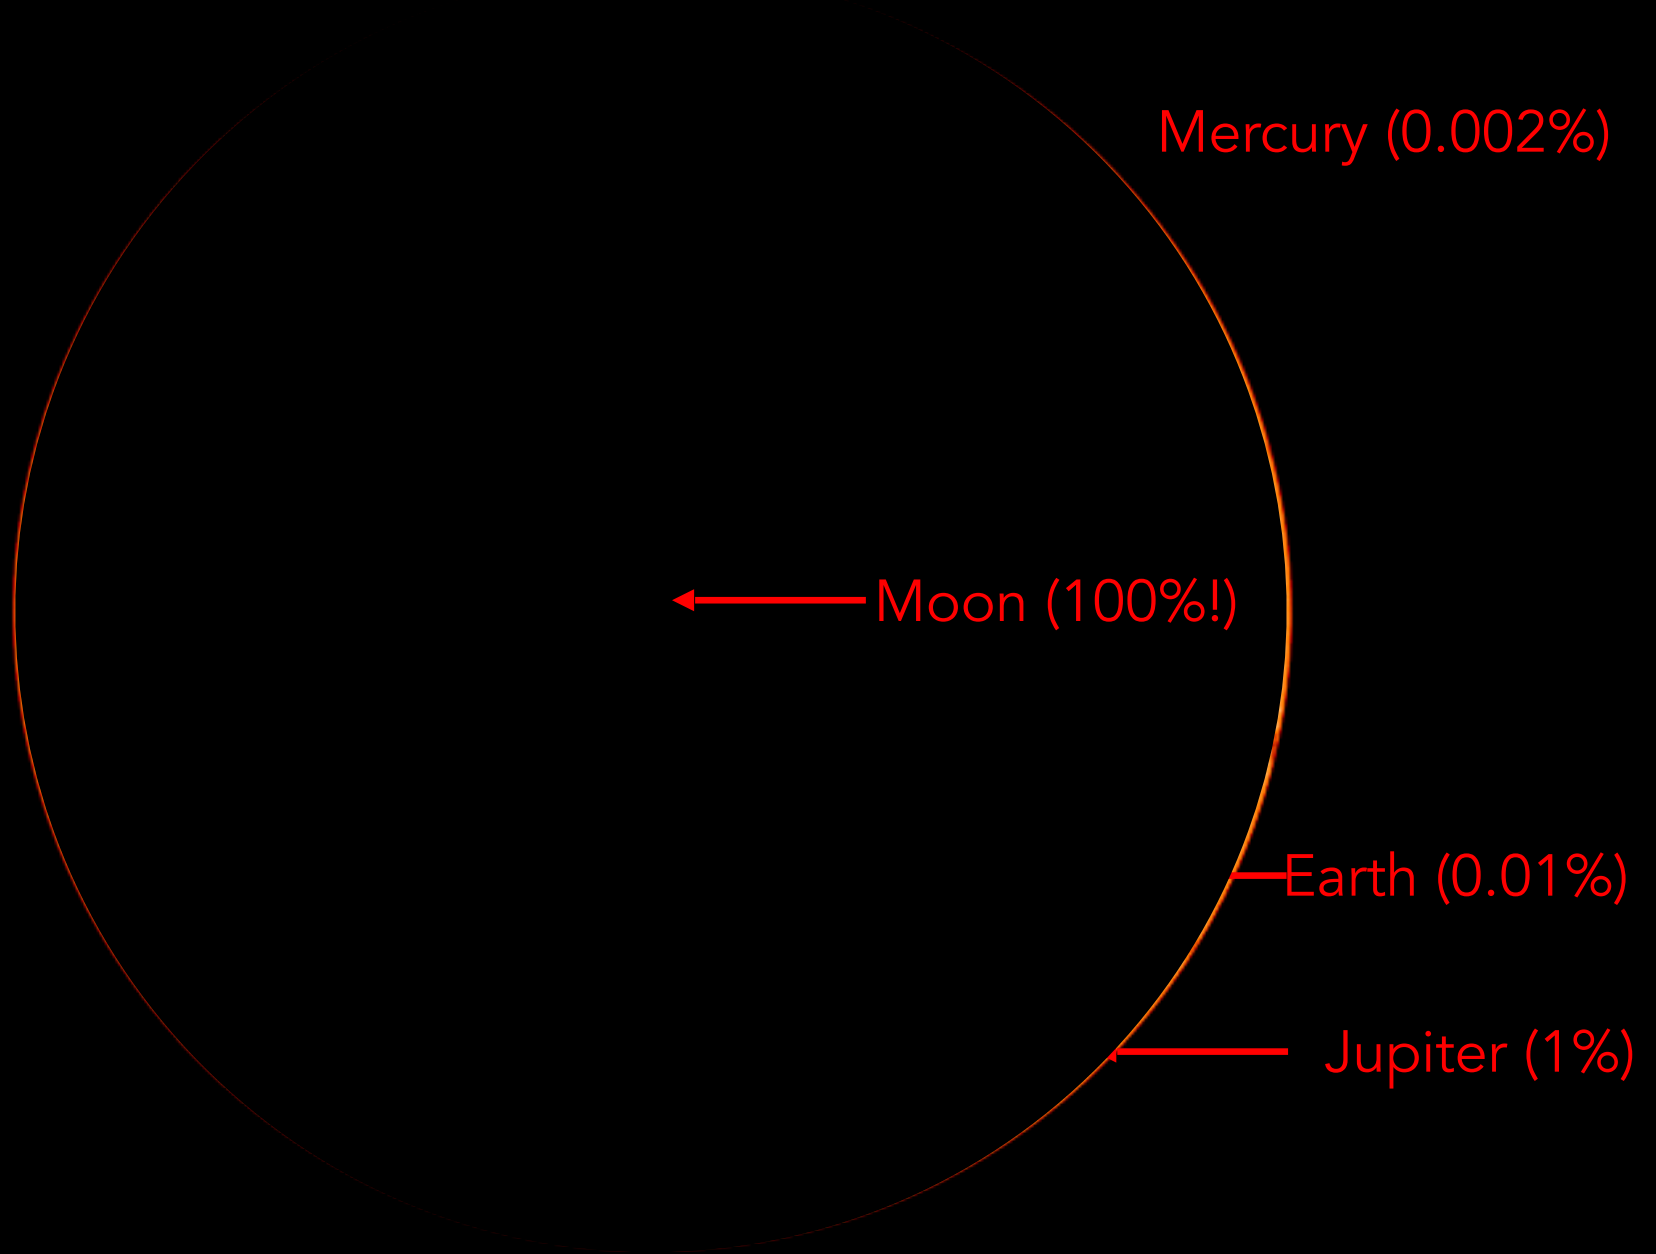

What is the true underlying population?

What are the formation and migration mechanisms that explain the observations?

How does planet occurrence change with stellar properties?

The Transit Method

The NASA Kepler Mission

Launched in 2009

Designed to
measure η_{Earth}

Using the transit
method of planet
discovery

Monitored
200,000 stars for 4
years

First light curves from Kepler...

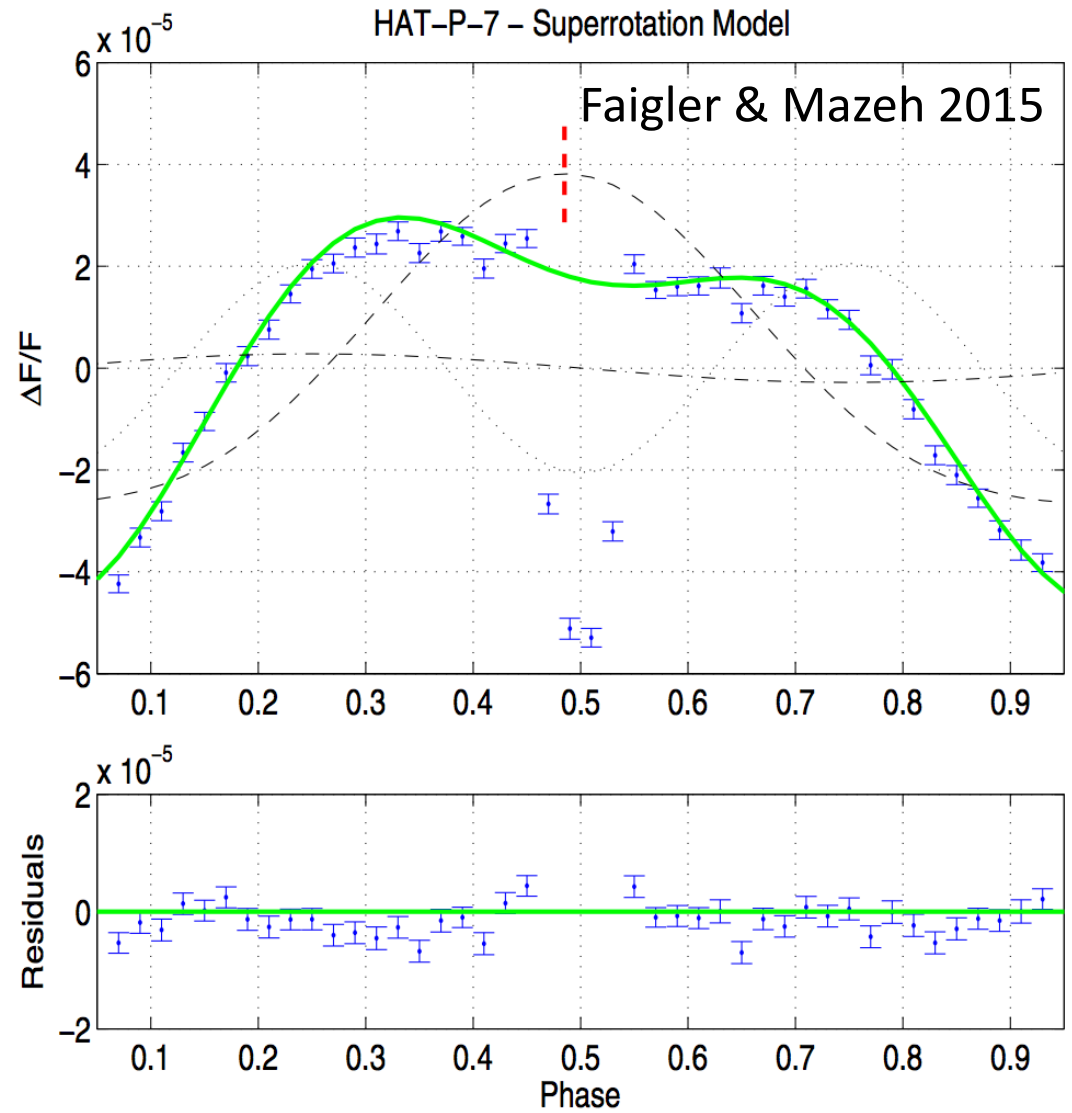

16,620 HATNet data points (57.7 days of data)

Single night at 1.2 m FLWO with Kepler Cam

HAT-P-7b data from the ground
A. Pal et al., 2008

The impact of the Kepler Mission

NASA Exoplanet Archive

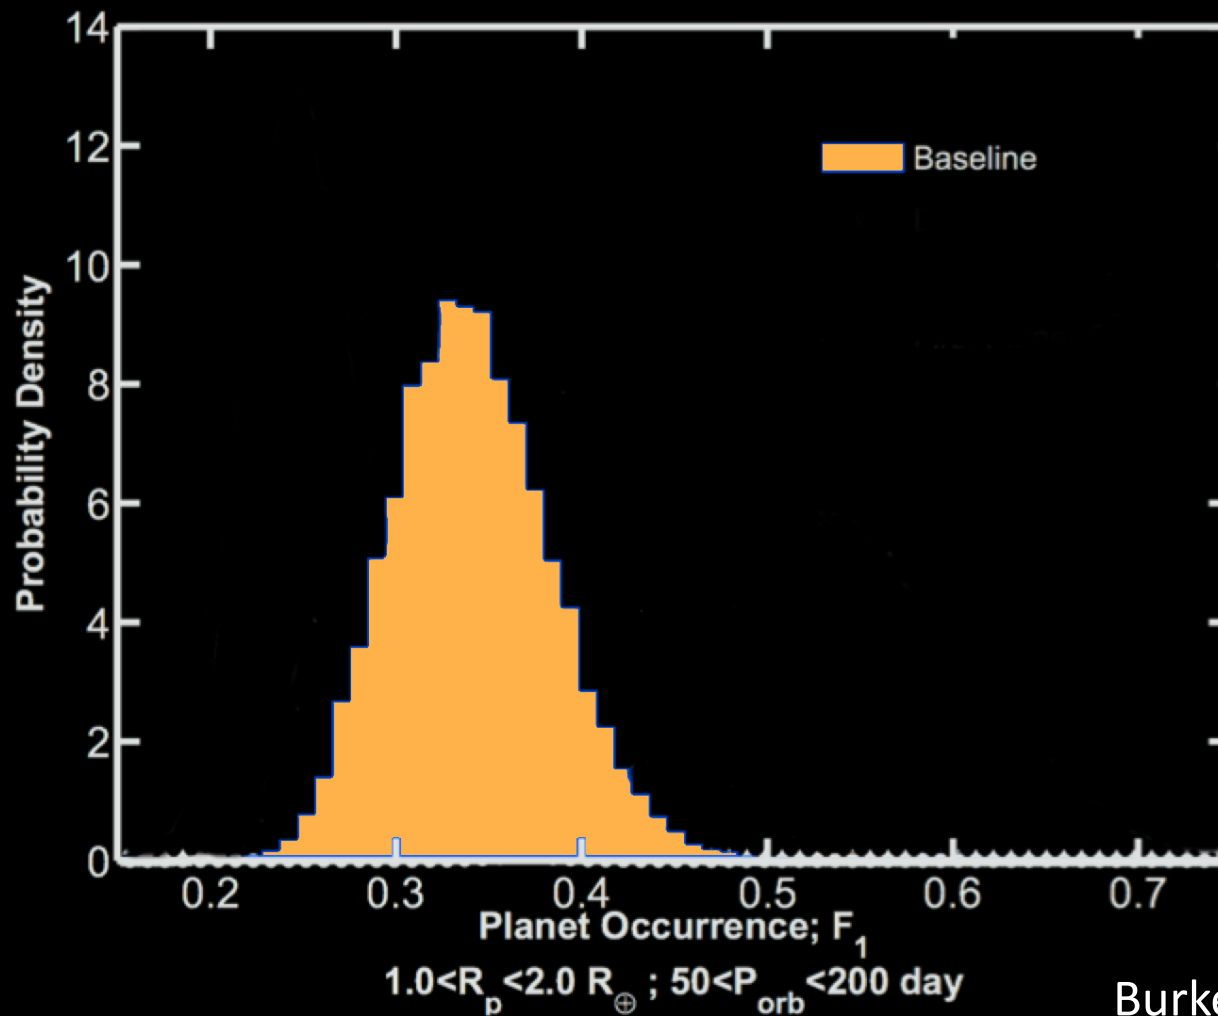

1989-2018

Thompson et al., accepted

Preliminary planet occurrence rates

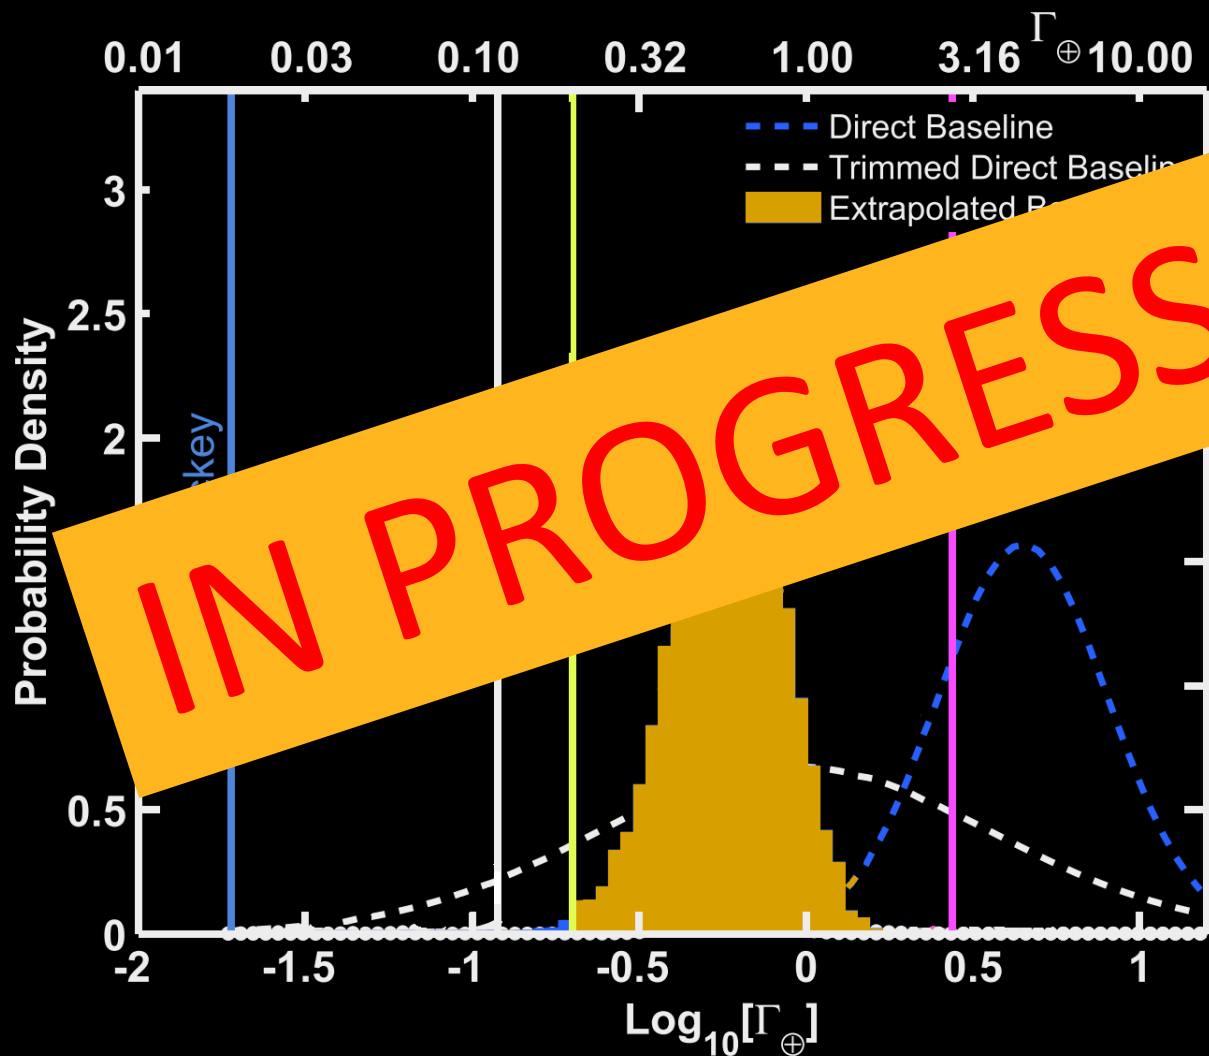

33% of sunlike stars have a planet 1-2 R_E with periods from 50-200 days

Burke, Christiansen+2015

Extrapolating to longer periods...

50% of sunlike stars have a planet like Earth – but this is still wildly uncertain

The K2-138 system (Christiansen et al. 2018)

Each year = 12.8 days

Each year = 2.5 days

A very compact system of **five sub-Neptune planets**

A Special Spacing...

3:2

● Relative size of Earth

K2-138 has the **longest chain** found close to this type of fundamental resonance

These resonant chains give us **important clues** as to how planets form and migrate

Earth
Mars
Jupiter
Saturn
Uranus
Neptune
Pluto

The legacy of the NASA Kepler Mission...

The NASA TESS Mission

Launching in
2017! 2018!

4x10cm optical
telescope

Designed to find
nearest planets

Using the transit
method of planet
discovery

Monitoring
200,000 stars for
up to 1 year

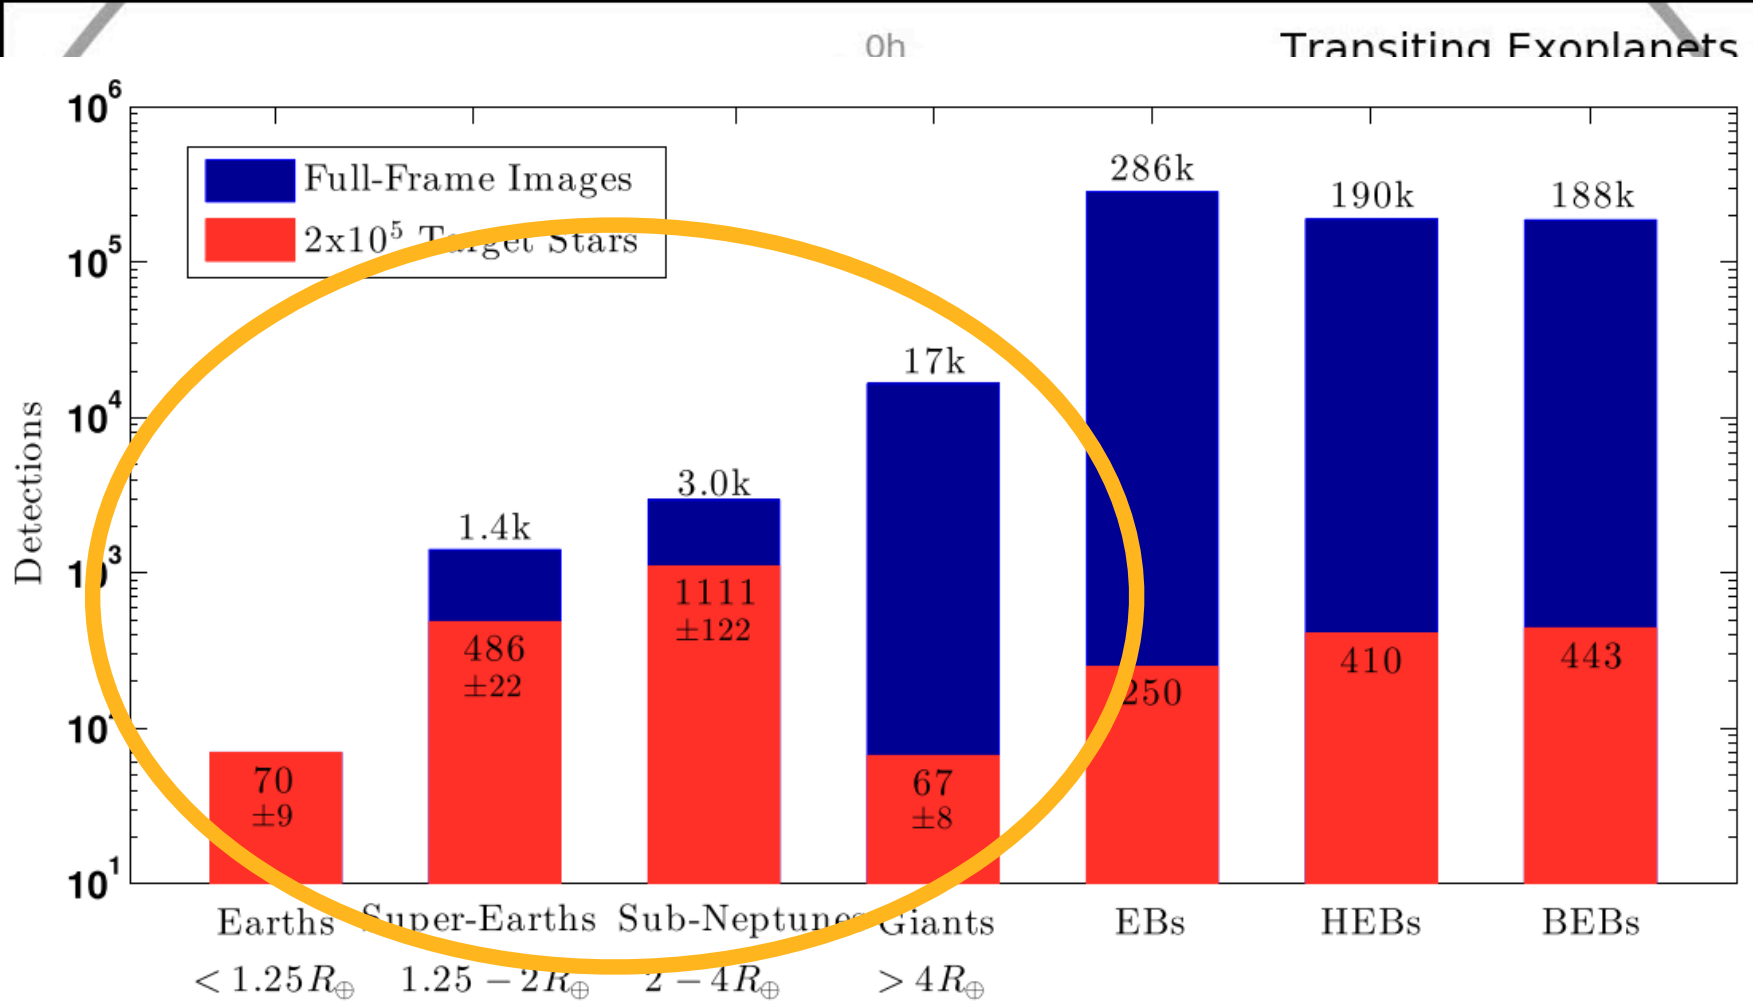

The NASA TESS Mission

[TESS observing strategy video](#)

The NASA TESS Mission

23,000 planets
(not planet candidates.... *planets*)

Following up TESS Planet Candidates

TESS is going to have a LOT of planet candidates...

... And

Light Curves from 200,000 Stars ("Postage Stamps")

TESS

Ground
Telescope

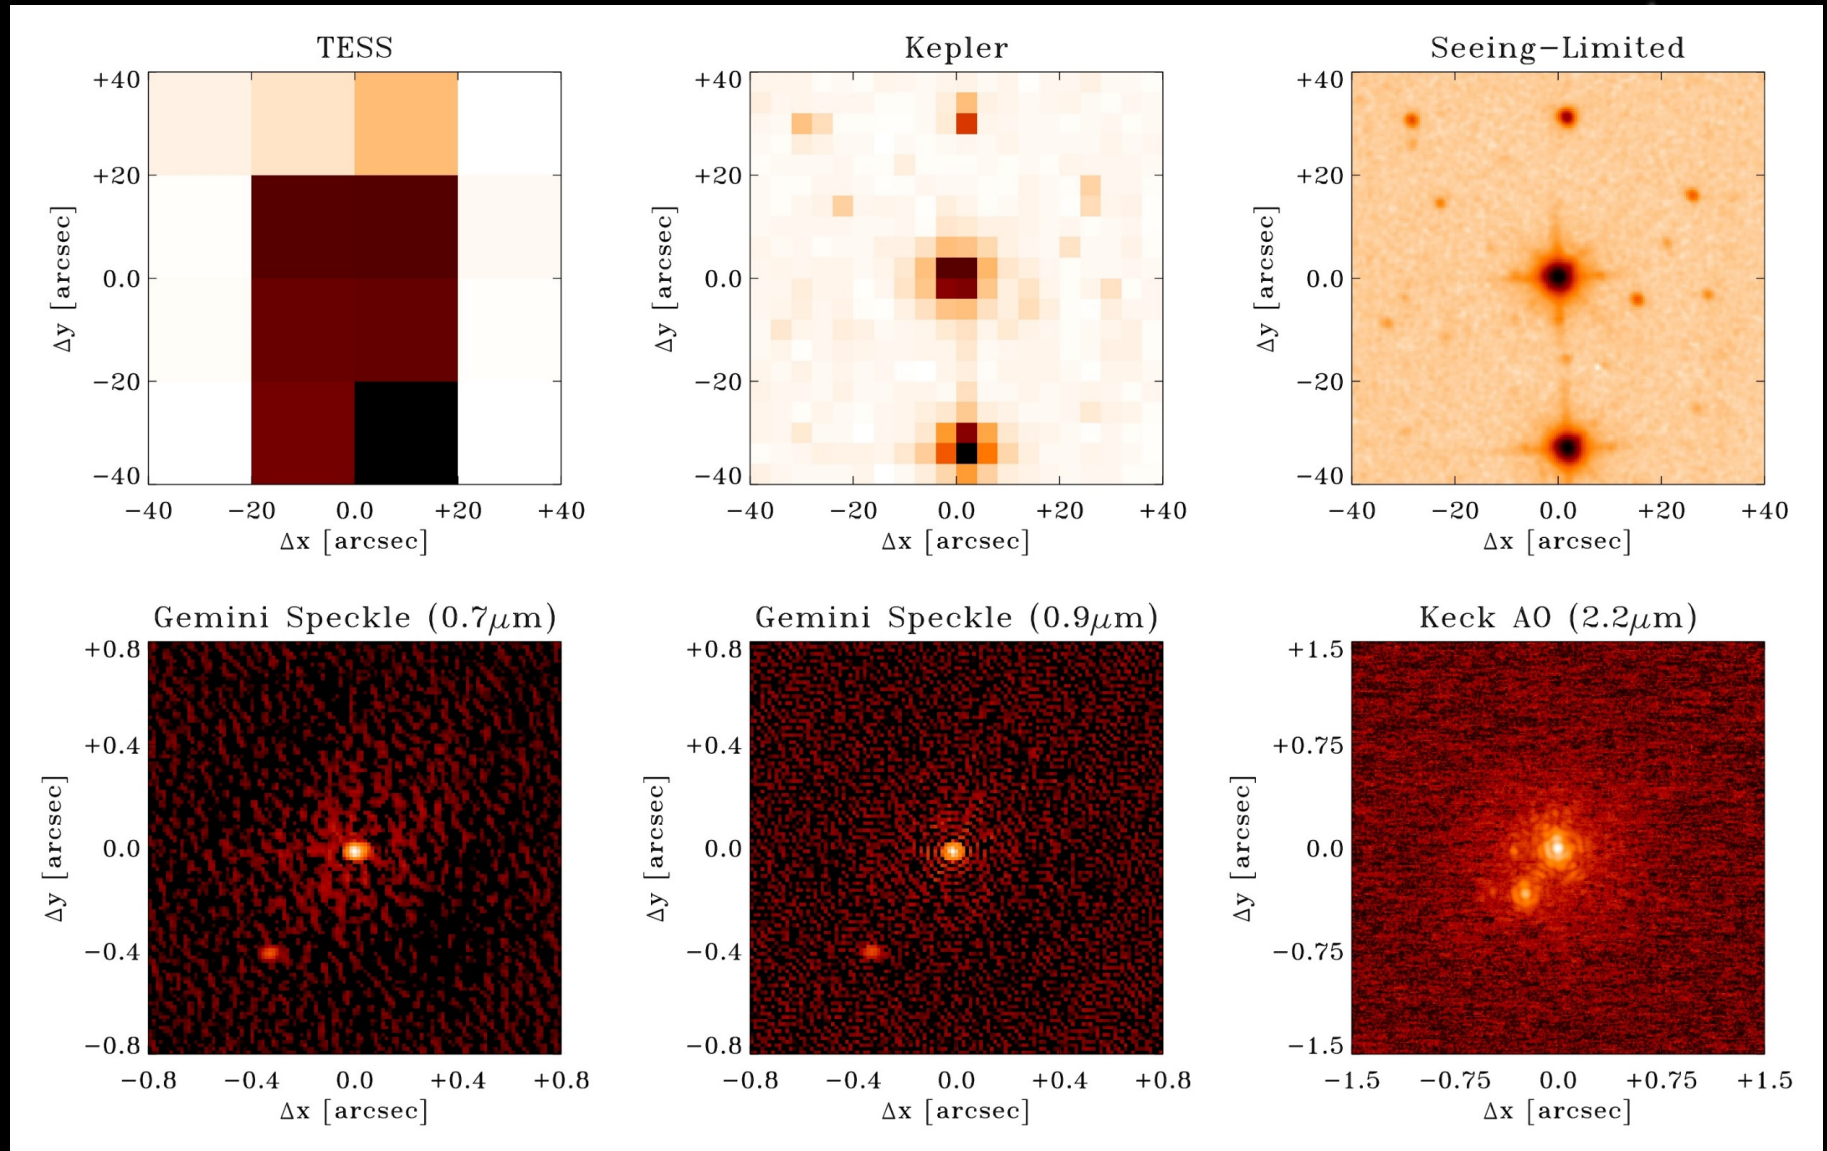

S

ATION

ected
ler

TESS has big pixels...

Ground-based, seeing-limited photometry

Most pixels will have >1 stars!

We will need a much larger ground-based effort to identify the source of the transit signal and to identify which are the most promising candidates after correcting the resulting planet parameters

*Contamination is one of the metrics for selecting the 200,000 target stars

How can St. Mary's get involved?

The TESS Follow-up Observing Program (TFOP) has organised a series of sub-groups

Karen Collins (karenacollins@outlook.com) is marshalling the army of ground-based resources – small telescopes in use by colleges or amateurs across the world

The instruments on hand at the Geissberger Observatory position St Mary's to continue Ron Olowin's legacy

Candidates will be released on a ~monthly basis for at least 2 years – there will always be more things to **observe!**

Thank you...

...Ron and Mary Olowin

...Jane and Louis Geissberger

...St Mary's College of California

...my excellent colleagues

...my wonderful family
